Integrating a CMS for Efficient Website Management

Part 1: Office Roleplay Dialogue

Scenario: A Web Developer, Ayaka, is working with her colleague, James, to integrate a **CMS** (**Content Management System**) for their company's website.

James: Hey Ayaka, I saw that we're switching to a **CMS** (**Content Management System**) for the company website. How's the integration going?

Ayaka: It's going well! We decided to use WordPress because of its flexibility. I've already installed a basic **theme** and configured the settings.

James: That's great! Are you using any plugins to add extra features?

Ayaka: Yes, I installed an SEO **plugin** to help improve search rankings and a security **plugin** to protect against threats.

James: That makes sense. How's the **content editor**? Is it easy for non-technical staff to use?

Ayaka: Yes! The **content editor** is user-friendly, so the marketing team can update blog posts and images without needing to touch the code.

James: That'll save a lot of time. What about the **backend** setup? Have you customized it yet?

Ayaka: Not yet, but I'll be adding some custom fields and modifying the dashboard for better workflow.

James: Sounds like a solid plan! Let me know if you need help testing the setup.

Ayaka: Will do! Once everything is configured, we'll be ready to launch.

Part 2: Comprehension Questions

1. Why did Ayaka choose WordPress as the CMS?

- (A) Because it is the only CMS available
- (B) Because it does not require a database
- (C) Because it is flexible and easy to use
- (D) Because it automatically translates content into different languages

2. What is a plugin used for in a CMS?

- (A) To add extra features and functionality
- (B) To delete all content from the website
